Subject: Unconventional Gas Inquiry

As the first word highlights, why do we need to explore unconventional methods when conventional methods can provide more than enough to meet our current and ongoing requirements?

To help you understand this, the Oxford dictionary defines "conventional" as "according to convention" and "convention" as "a way in which something is usually done ⇒ socially accepted behaviour"

Conventional methods in this day and age have a socially responsible component to them and we know that there are now ways that we can meet our energy requirements that have no adverse effects

-- so let's put our energy (excuse the pun) into activities that are known to have no adverse effects.
