It's very simple. The energy required to procure these forms of gas is a large percentage of the gas gained. If you subtract the former from the latter, you'll see that there is little gain for all that work.

When this is the only way to obtain gas, then we have used up the easily available supply. That should be a message that we are getting close to the end. We should get ourselves out of the coal/oil/gas mindset.

Instead, we should be putting money into "unconventional" energy sources such as solar and wind. It has been said that people did not leave the stone age because they ran out of stones.
