

To the Environment and Planning Committee,

I am very concerned about the possibility of the non renewable unconventional gas industry becoming involved with Victoria's, and Australia's energy supply.

Unconventional gas is finite and has the adverse consequences of being costly, potentially harmful to people and animals, impacting negatively on it's immediate and surrounding geographical environment, contributing to pollution and escalating climate change.

It is not as if we don't have an alternative and by that I mean renewable energy sources which, in comparison, has minimal negative consequences.

It's a no brainer - it would be better we looked to the future and use our, and your, energy, money and time to adopt, promote and develop renewable energy sources.
