Subject: Submission to the Environment & Planning Committee Inquiry into Unconventional Gas in Victoria

To the Environment and Planning Committee,

I believe that for the future health of the people and the natural environment of Victoria, renewable sources of energy such as solar and wind should be pursued. There are adequate opportunities in this state to access these clean energy options. There is therefore no need to pursue the risky business of unconventional gas.

Unconventional gas is polluting and contributes to climate change. Coal seam gas carries real and proven health risks to people, a clean water supply and our agricultural industry.

Many Victorian communities are concerned about the risks of unconventional gas. Please respect their wishes.

Linley Walker
