### YOUR SUBMISSION

**Submission:**

Australia's future is with green hydrogen and green hydrogen export.

The green hydrogen industry will be incredibly beneficial for Australia and will spawn other industries.

Right now the hunger for green hydrogen in the world is immeasurable. This is because everyone knows what is coming and they don't want to lock themselves into another long term "clean" fossil generator.

So right now they will buy all we can produce at a premium price.

And as we ramp up exports and reap the benefits, price can be lowered.

I strongly recommend to look at what Andrew Forrest, FMG, is doing. They are ramping up to 1,000 GW of green hydrogen. That amounts to about 10% of global electricity demand.

SA Labor has picked up the opportunity and launched a similar but less grand plan, of course, last week.

Saudi Arabia has similar plans.
