Submission:

In and around my region of Central Victoria we are surrounded with bush land. Many of this is thick scrub that has not seen a fire in many decades. Some of these areas are now seeing cool fuel reduction burns that are producing smoke and reducing clean air quality. But all of this is short lived as within a few days we start to get clean air again. These burns are vital to the region otherwise during the summer months and the increase in hot weather, we could be in dire straights if we get fires like we have had in the last few summers. A bit of air pollution is worth putting up with than having possible lives lost and property damage. I do realise that some people may have health issues regarding pore air quality for a few days. But that is better than suffering weeks or even months of pore air quality if we get massive bushfire threatens the whole State or Regions.
