

The committee manager
Standing committee on Environment and Planning
Parliament House

To the Committee Manager,

I am in full support of removal of the Nuclear Prohibition in Australia. There are currently over 450 Nuclear power plants operating world wide, we have had 3 incidents with regards to nuclear power plants over the last 40 years.

People have short memories and can only ever remember the bad publicity generated by these 3 incidents, and forget the 450 plants still operating without any problems.

You need to look at the technological advancements, improvements, that exist today and under development when it comes to nuclear power generation. 34 years ago Chernobyl and you would have to say today is much safer place and computers more advanced as this is when computers were just developed back in the 1980's.

Why should Australia outlaw such technology amazes me I will be turning age 50 next year, it would be nearly another generation before a nuclear power plant would be operational in Australia when it is needed today to bring down electricity costs for everyone.

The opportunity that would go with building a nuclear power plant in Australia opens up a whole new industry which is needed for jobs for the younger generations.

An opportunity also exists in coming up with a solution for the radioactive waste, there may not be one at the moment, like everything this is where the challenges exist, it should not be seen as a reason to not allow removal of nuclear prohibition.

Regards,

Damian Jones MSc (log)
