

\*Please note that the daily numbers may differ from what was reported in the Sitrep due to reclassifications.

A reclassification occurs when an historic case (*ie. diagnosed on a date prior to yesterday*) has their classification changed, and either becomes confirmed or no longer confirmed. This can occur when:

A case is initially notified as a confirmed case but is deemed as a false positive or persistent shedding is identified and is retrospectively rejected and removed from the total case number  
 Duplicate events for the same historic case are merged together, resulting in a decrease of numbers  
 Data entry or handling errors which are subsequently rectified

The timeframe over which these reclassifications occur depend largely on when further details become available and the existing case load, with increased numbers in daily cases resulting in delayed reclassification of cases.
