

Dear SARC members,

I am a mother of two children and an Intensive Care Nurse of 20 years at The Alfred Hospital. I am very concerned about NO Jab NO Play as I believe it will have a devastating impact on the community. I started vaccinating my first child but after alarm bells rang I started researching. I have researched vaccines and their efficacy for 3 years now and have chosen to exercise the precautionary principle. We have been told over and over that the science is clear. It is definitely not. I have found there are certainly more questions than answers.

There is a mountain of research that raises some very concerning issues with vaccines but as it is not reported by the media, the general public are not aware and it doesn't seem to filter through to the wider medical community. However, there are many MDs (particularly pediatricians and neurologists), scientists and researchers who are concerned about vaccines and have spoken out. It was hearing and reading their concerns that prompted me to research further. Please look up Dr. Lawrence Palevsky, an experienced, sensible pediatrician.

We know there's an epidemic of neurological disorders and autoimmune disease (including anaphylaxis) amongst our children. This generation is the sickest in history. It is accepted that this must be an environmental issue that's created such a dramatic change in the last 30 years. These conditions were rare prior to the dramatic increase in vaccines. There is a large body of scientific evidence that suggests vaccines are not as safe as we have been led to believe. Also the volume of anecdotal evidence is hard to ignore. I know kids that have been vaccine injured.

There are many questions that need answering. Where are the studies comparing the total health outcomes of vaccinated versus non-vaccinated populations? What are the long-term effects of atypically manipulating the immune system in very young infants over and over again (over a lifetime)? Where do the materials in vaccines go in the body? The adjuvants are known toxic agents. Where is the unbiased research (not funded by a drug company) proving that they're safe for everyone? Why are there disease out-breaks amongst the vaccinated population? Do diseases mutate due to vaccination? After receiving a live vaccine there is a contagious period, so couldn't that be a source of spreading disease? What about the foreign DNA in vaccines and the impact on the body? Some scientists are concerned about a cancer link. What if you have autoimmune disease in the family? Or a methylation gene mutation or mitochondrial disorder undiagnosed? These are just a few of the many questions I have.

It is because of these unanswered questions I'm not prepared to take on the risk of the vaccine and choose to exercise the precautionary principle. I have the right to medical freedom and informed consent.

The main purpose of The Charter of Human Rights and Responsibility is to protect and promote human rights. No jab no play is clearly in conflict with The Charter. Particularly this aspect: "Freedom of thought, conscience, religion and belief". It will be impossible to exercise that freedom without paying a penalty and being treated unequally as access to childcare and kindergarten will be withdrawn.

"A person must not be coerced or restrained in a way that limits his or her freedom to have or adopt a religion or belief in worship, observance, practice or teaching". No jab to play is a form of coercion. Some parents don't have an issue with vaccines but are concerned about the aggressive nature of the schedule and choose to delay and/or separate vaccines. NO jab no play will coerce many parents into giving large amounts of 'catch up' vaccines which will no doubt have dire consequences. The implications of this are serious. Given that there is no vaccine injury compensation scheme here in Australia, unlike 19 other countries, if you have a devastating injury, you are on your own.

I won't be coerced as I have done my research and am not prepared to take the risk as we have a strong family history of autoimmune disease. I am a diligent, health conscious parent that loves disease prevention and epigenetics and support my children's health through natural means. Is it ok that despite having strong healthy children who have never had anything more serious than a common cold, my child won't have the right to child care or kindergarten? As an Intensive Care nurse in a busy public hospital, I will not be able to work. My child will be deprived of the social and learning opportunities of day care and of kindergarten. How will I prepare my child for school?

Please do your own detailed research on this topic. Thank you for reading my submission.

Kind regards,
